

**European research and innovation on
EuroHPC systems
Dr. Lilit Axner
Programme Officer at EuroHPC JU**

EuroHPC
Joint Undertaking

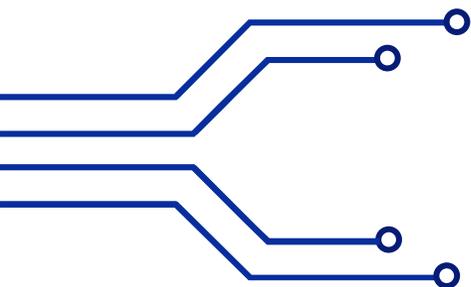

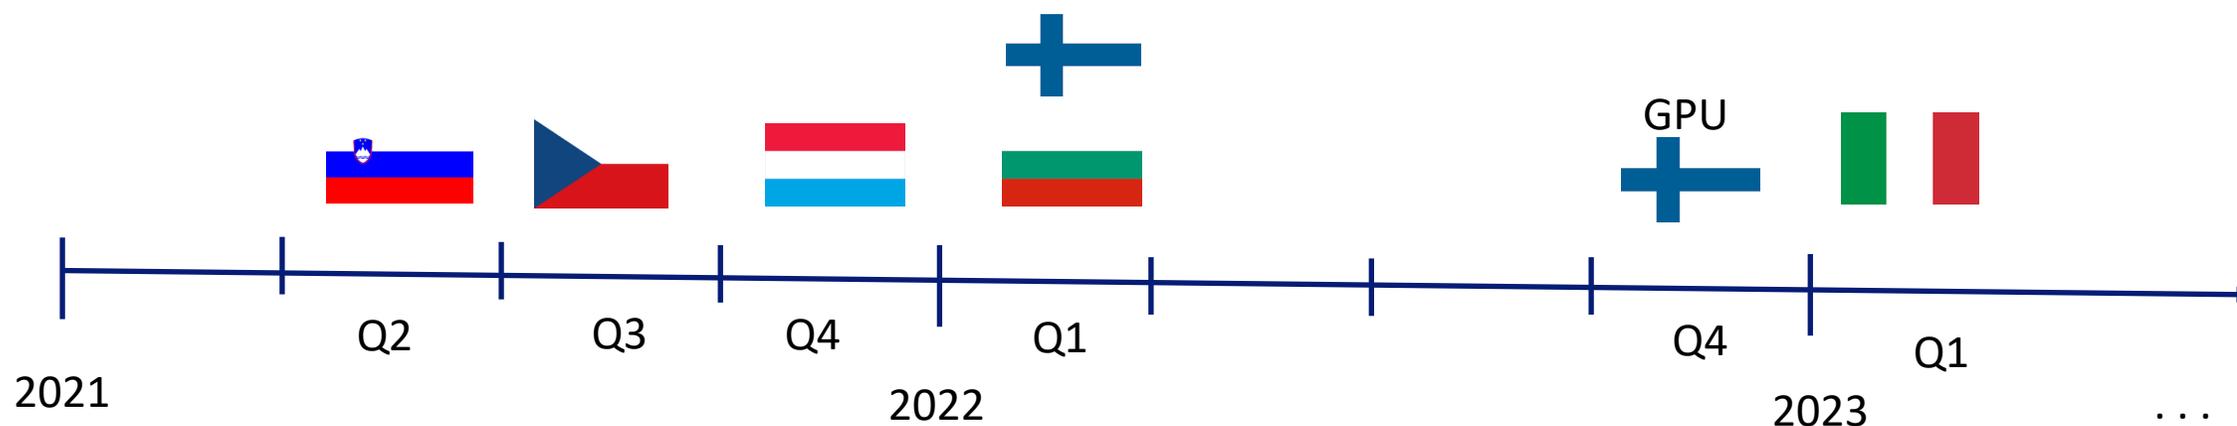

Why do We Need Supercomputers?

**USERS: Innovation and Evolution
through Collaboration!**

Systems in production: The timeline

The first EuroHPC JU access projects started 1st of June 2021 and the second applicant was the Swedish SME **NorthVolt** (now a large company).

1,5 years of EuroHPC JU systems usage

- As of 31 December 2022 there were **394** projects of these **~11% (private and public administration sector)**
- **20** SMEs (7 through Regular access calls)
- **21** governmental organisations (3 through the Regular access calls)
- SMEs are from Sweden, Spain, Slovenia, Turkey, Italy, France, Finland, Croatia and Belgium.

Types of access

EuroHPC JU Extreme Access

For getting a large amount of compute time (12 to 24 month access)

EuroHPC JU Regular Access

For getting a large amount of compute time (12 month access)

EuroHPC JU Development Access

For developing your solution or software (6-12 month access)

EuroHPC JU Benchmark Access

For benchmarking and small tests (3-month access)

Application portal <https://pracecalls.eu/>

*NOTE: Extreme Access calls target flagship applications that scale to thousands of CPUs and GPUs

Film produced by ENCCS

NCCs are your help centre!

The National Competence Centres (NCCs) are the **central points of contact** for HPC and related technologies in their country.

Their missions are to:

- Develop and display a comprehensive and transparent map of **HPC competences and institutions** in their country
- Act as a **gateway for industry and academia** to providers with suitable expertise or relevant projects, may that be national or international
- Collect **HPC training offers** in their country and display them on a central place together with international training offers collected by other NCCs
- Foster the **industrial uptake of HPC**

Number of Applications per Country by December 2022

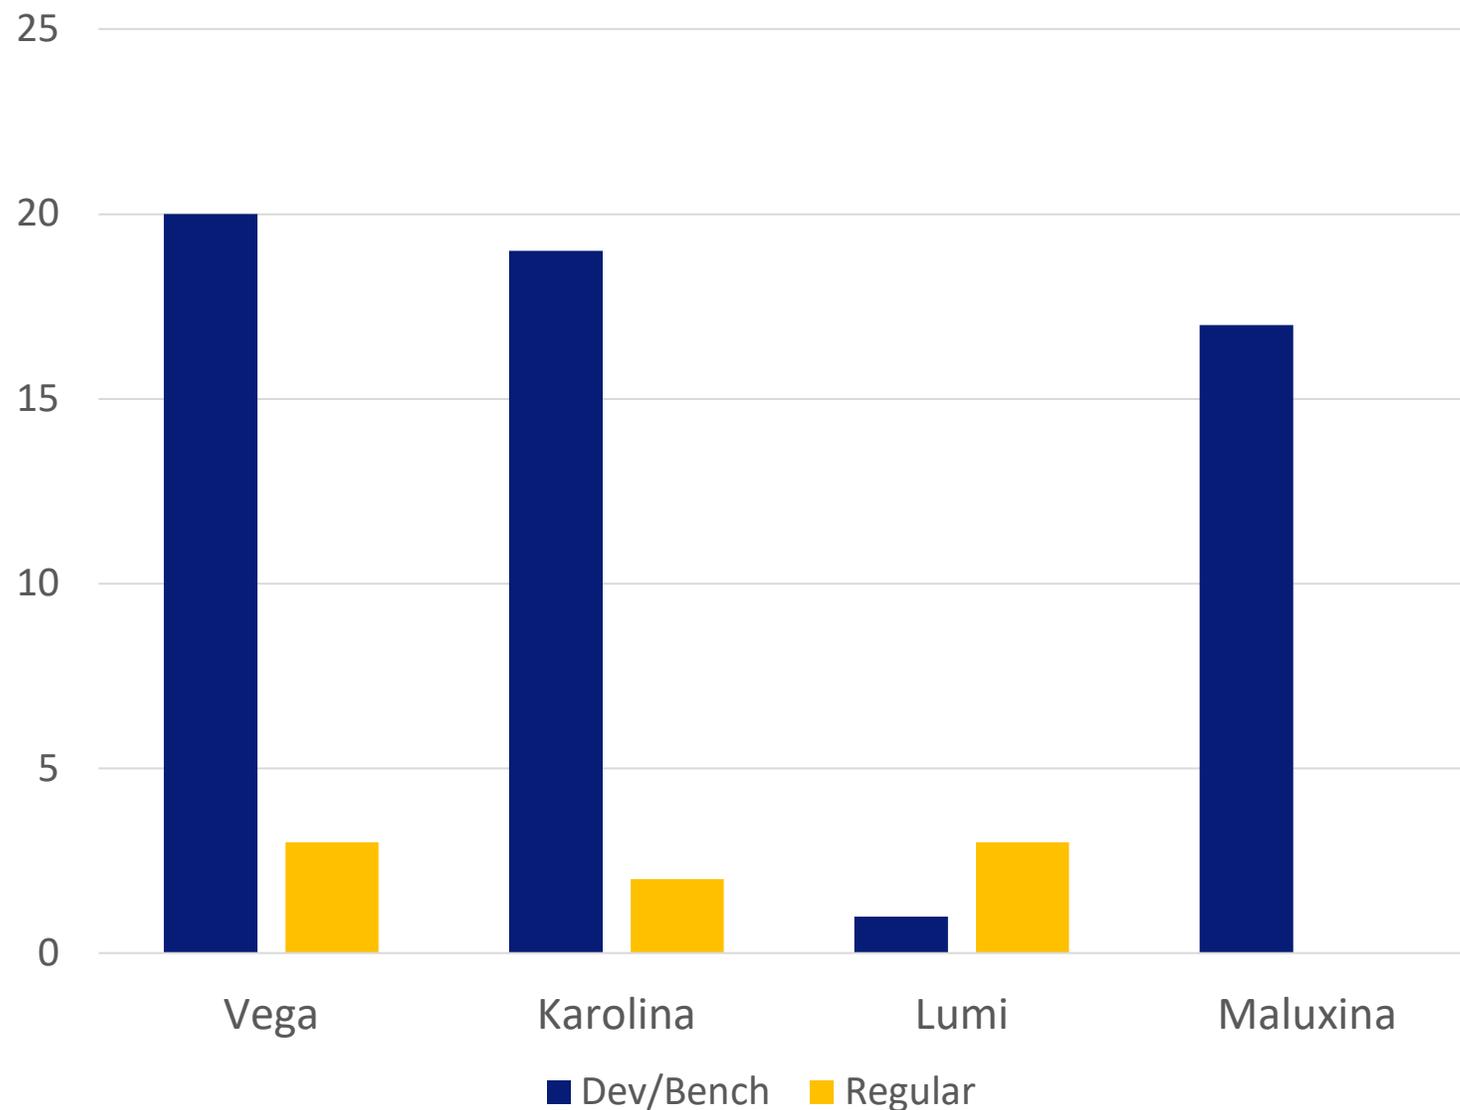

Number of Applications per Discipline by December 2022

AI Applications per System by December 2022

AI: Machine learning/NLP

Using EuroHPC Vega System by the Swedish National Archives

Vega for training and inference

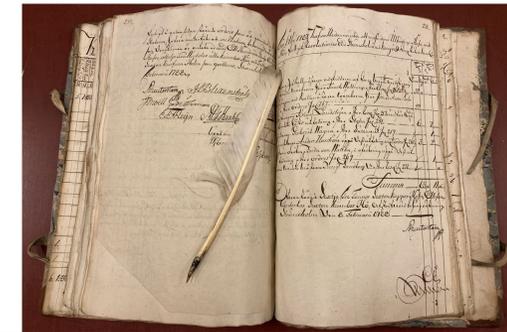

- Training the SATRN-model on Vega enabled us to increase the scale of the resized images going into the model, thereby improving accuracy for handwritten text, which generally requires more information than printed text
- Running 9 million images through the pipeline on VEGA took roughly 90 node-hours
- At a hit-rate of 90% this project saves us about 700000 euros in manual labor costs, and the indexing database gets created a lot quicker

Adapting AI-technology for use in archives

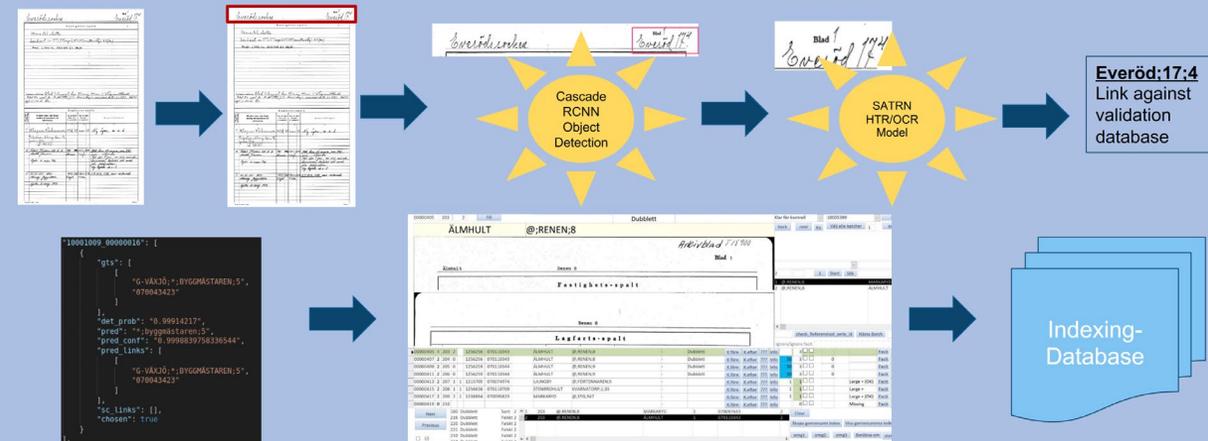

- Image segmentation models
- Text-recognition

Make scanned images searchable

384 000 GPU core hours
(Development Access, VEGA)

The Property Record Indexing Pipeline

Using EuroHPC JU Vega System by the Croatian SME Called TIS

System for Early Neurological Deviation Detection

A unique **AI** solution for assessing the quality of spontaneous movements (fidgeting).

The target:

Children in early infancy (2-3m)

The purpose:

Detecting infants at high risk of neurodevelopmental disorders or expected normal outcome in a group of neuro risky children

Goal: AI system automatically detects neurological risk infants

**EUROPSKI STRUKTURNI
I INVESTICIJSKI FONDOVI**

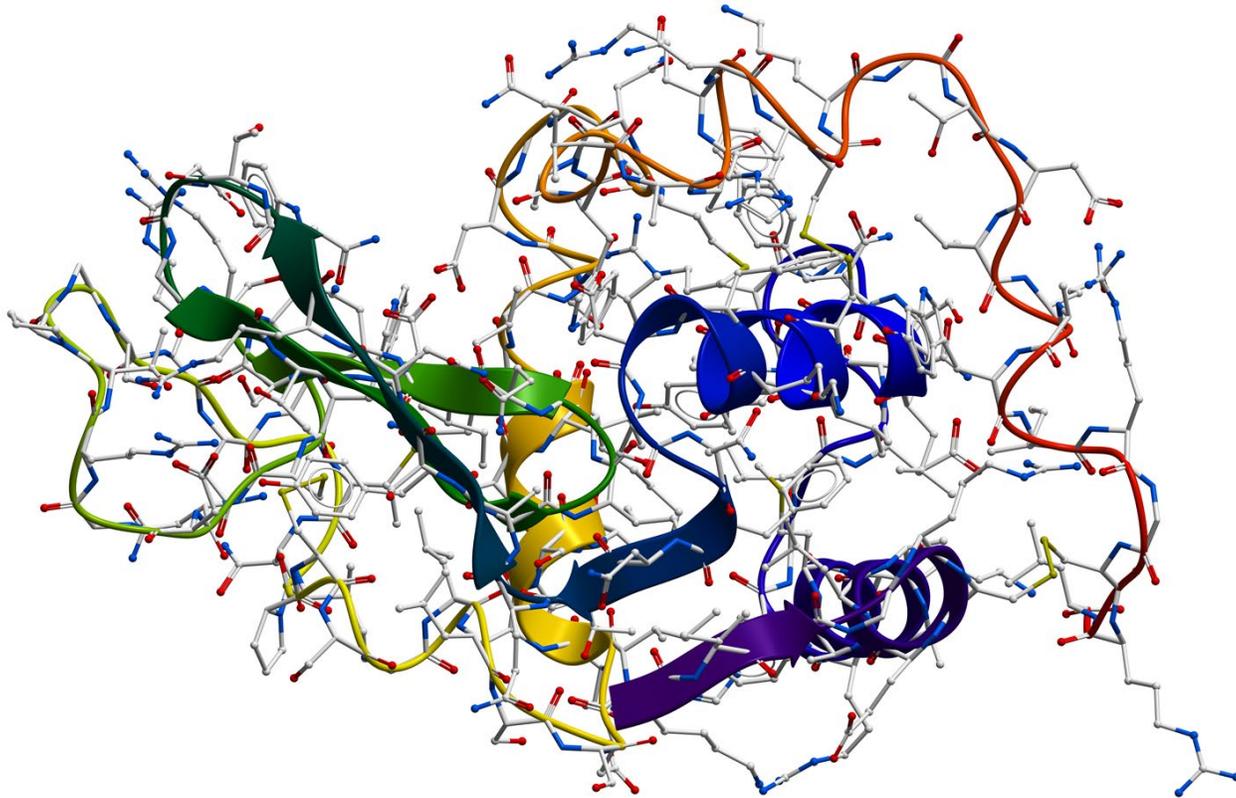

Simulations of the electrochemistry relevant for battery development

Use of classical and reactive molecular dynamics and quantum chemical simulations to devise bottom-up design strategies for improved batteries.

northvolt

Skin permeability

- Atomistic model of the main barrier in human skin
- Predict drug permeability using molecular dynamics simulations (GROMACS)

1 920 000 CPU Core Hours

384 000 GPU Core hours

Using EuroHPC JU MeluXina System by Researchers at UC Louvain, Belgium

Towards scalable CFD simulations using MeluXina

Thomas Gillis, Pierre Balty, Philippe Chatelain

> goal

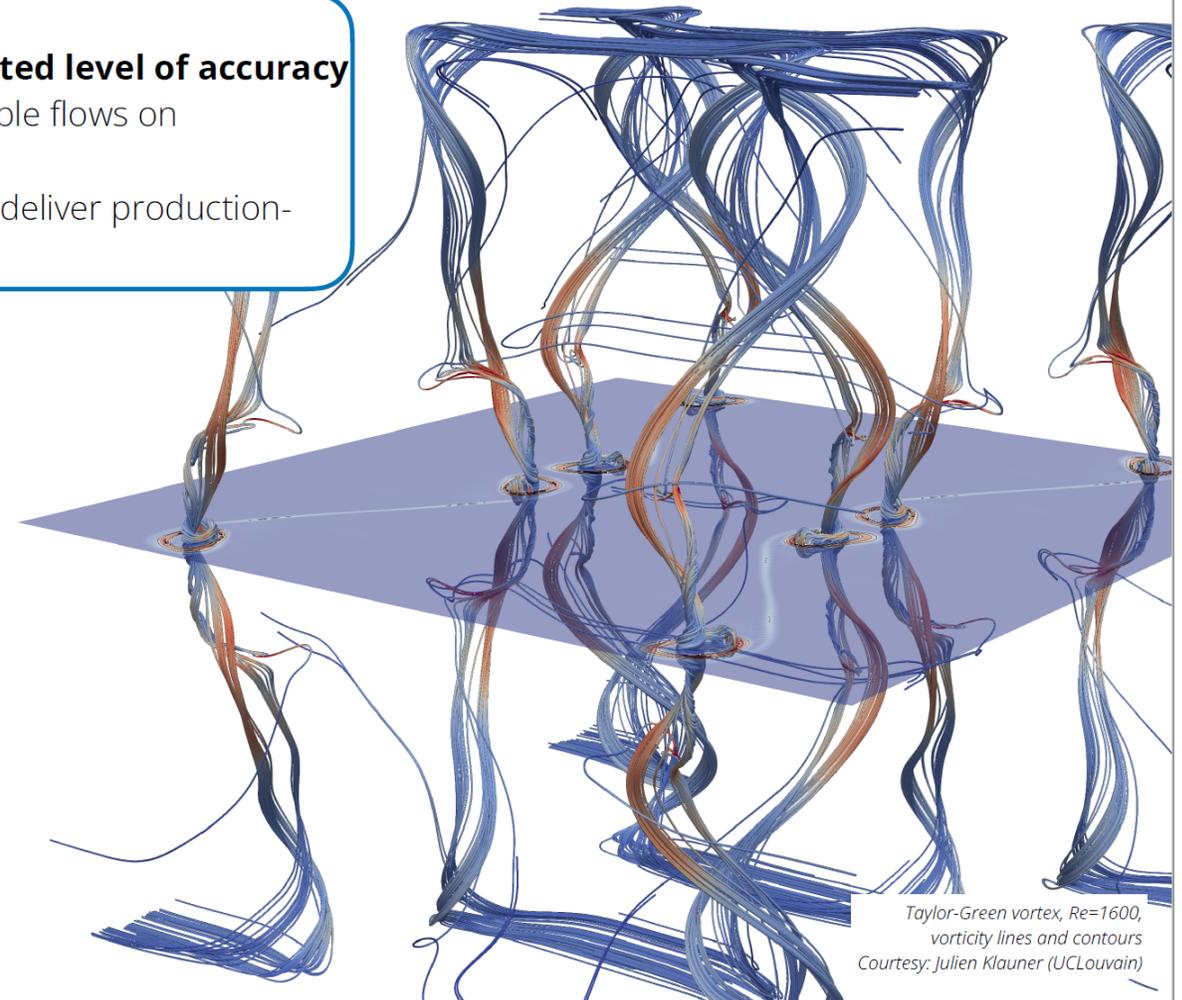

- Understand and explore fluid phenomena at **unprecedented level of accuracy**
- Development of a 3D simulation codebase for incompressible flows on **massively distributed systems**
- **Combine advanced MPI with applied mathematics** to deliver production-ready software

> flups

- Fourier-based Library of Unbounded Poisson Solvers
- User-friendly, scalable, and fast

> murphy

- wavelet-based multiresolution simulation framework
- High order FD and compression
- One-sided communications (MPI-3.1)

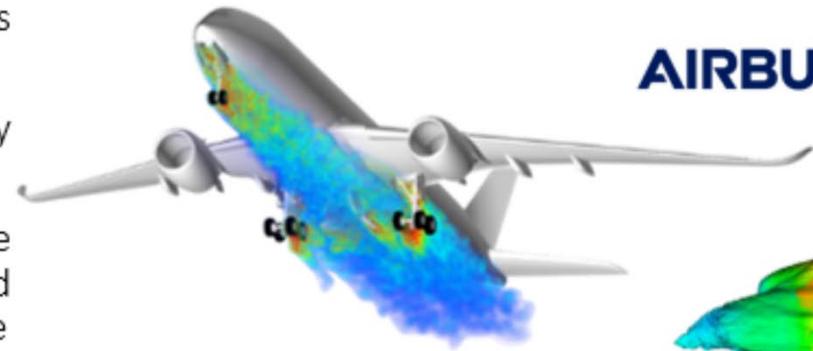

Using EuroHPC JU LUMI System For an EU Collaborative Project

SCALABLE Lattice-Boltzmann CFD simulation at Exascale

Goals:  

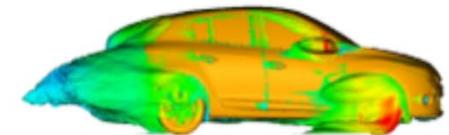

- Assessment of top industrial (LaBS/ProLB) and academic (waLBerla) solver differences and understanding of key drivers for optimal performance, while preserving industrial needs as “best solution” industrial solver
- Performance, scalability, and energy efficiency optimizations
- Code generation for LBM addressing runtime specifics to enable greater versatility and performance for next generations of HPC hardware
- Usability and operability increase of highly scalable HPC systems for industrial applications
